

# Dahlen Long Term Fertilizer Experiment

Rob Norton,  
Regional Direction, Australia and New Zealand

Taylors Lake, September 2011

# Long term trial site – established 1996

- Four rates of P (TSP)
  - 0, 9, 18, 36
- Five rates of N (Urea)
  - 0, 20, 40, 80, 160
  - No N in legume phase
- N applied either
  - All at sowing/split 50:50
- Each year the site sown to a single crop.
- Soil samples, grain harvest, nutrient content.

Direct drilled,  
zero cultivation,  
stubble retained.

# Why have a long term experiment?

- Use to document trends in yield and quality over time.
- Follow the build up or depletion of nutrients in soil.
- Used for calibrating soil tests (eg DGT-P).
- Education & demonstration.
- New questions.

Longerenong Rotation 1 – 1916

Broadbalk, Rothamstead, 1843

# Crops Grown

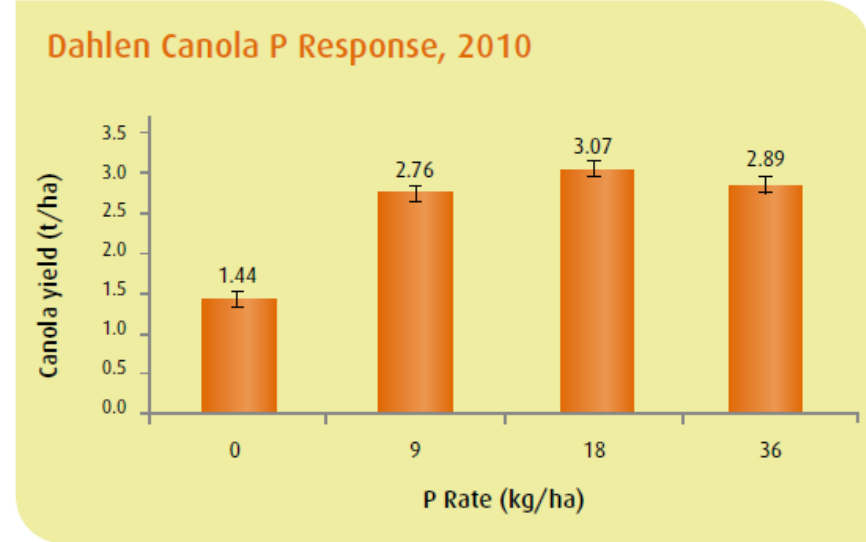

- Barley -1996, 2000, 2004, 2008
- Chickpea -1997, 2009
- Lentil – 2001 , 2005
- Canola -1998, 2002, 2006 , 2010
- Wheat - 1999, 2003, 2007
- 2011 in fodder oats (weed control)

# 2010 Canola

- Good year for responses
  - 0 N 0 P = 1.38 t/ha
  - 80 N 18 P = 3.45 t/ha
- Relatively small N response
  - Poor Barley 2008
  - Poor Chickpea 2009
    - Still fixed N
  - Some small benefit to splitting N

Graph 1

Graph 3

# Mean yields 1996 to 2010 (t/ha)

- Not the greatest set of years!!!
- 2 complete fails (both canola)

# Main effects 1996 to 2010

Year	1996	'97	'98	'99	'00	'01	'03	'04	'05	'07	'08	'09	'10

- 12/13 sign P response
- 6/13 sign Timing response
- 7/13 sign N\*P interaction

# How to evaluate these experiments

- Yields ?
- Profitability
  - Annual v Long term
- Efficiency – Many ways to do this
  - Partial Factor Productivity – Yield divided by Fertilizer applied
    - (If interested in straight production – how to get the most)
  - Agronomic Efficiency – Yield increase divided b fertilizer applied
    - If interested in efficiency of use of fertilizer
  - Partial Nutrient Balance – kg nutrient removed per kg fertilizer applied
    - If interested in the efficiency of nutrient use
- Nutrient Balance over time

# Across all years – mean of treatments

Average Grain Yield (t/ha)

## Year by Year best treatment (\$/ha)

Year	Crop	\$/ha	N	P
1998	Barley	952	160	36
1997	Chickpea	504	20	18
1998	Canola	534	80	9
1999	Wheat	250	20	9
2000	Barley	573	80	18
2001	Lentil	286	0	9
2003	Wheat	668	20	9
2004	Barley	48	20	18
2005	Lentil	267	160	9
2007	Wheat	329	20	9
2008	Barley	116	20	9
2009	Chickpea	1	40	0
2010	Canola	1319	40	18

# Average Best Treatment – 15 crops

- Based on gross margins
  - Yields as harvested
  - Costs
    - Wheat – \$183 /ha
    - Barley - \$171/ha
    - Pulse - \$273 /ha
    - Canola - \$222/ha
  - Prices
    - Wheat - \$220/t
    - Barley - \$200/t
    - Pulse - \$400/t
    - Canola - \$500/t
    - Urea – \$460/t
    - TSP - \$430/t

**Profitability \$/ha/y**

N	0	9	18	36
0	118	202	196	159
20	120	<b>244</b>	<b>246</b>	160
40	141	<b>229</b>	<b>243</b>	199
80	89	<b>235</b>	<b>254</b>	170
160	25	141	145	101

# Agronomic Efficiency

- When 9 or 18 kg P
  - First 20 kg N gets an extra 16 kg grain per kg N
  - More N gives more but not a lot more – diminishing returns!
- At 9 kg P
  - Some N gives about 50 kg grain per kg P
  - Additional P does not give a higher grain return

## Nitrogen AE (kg increase in yield per kg fertilizer applied)

N	0	9	18	36
0				
20	5.0	<b>16.0</b>	<b>17.1</b>	5.8
40	4.0	8.0	10.7	9.2
80	2.0	6.0	7.8	5.0
160	1.4	2.1	2.6	2.2

## Phosphorus AE (kg increase in yield per kg fertilizer applied)

N	0	9	18	36
0		31.1	17.7	9.5
20		<b>49.1</b>	27.6	9.8
40		<b>36.7</b>	24.9	11.8
80		<b>57.2</b>	36.5	14.4
160		40.3	25.4	12.1

# What about nutrient balance?

- Around 5 kg P removed if no P applied
- 9 kg P has about 3 kg P more P applied than removed
- 18 kg P has 11 kg P more applied than removed
- 36 kg P has 30 kg P more applied than removed.
- N had little impact on P removal

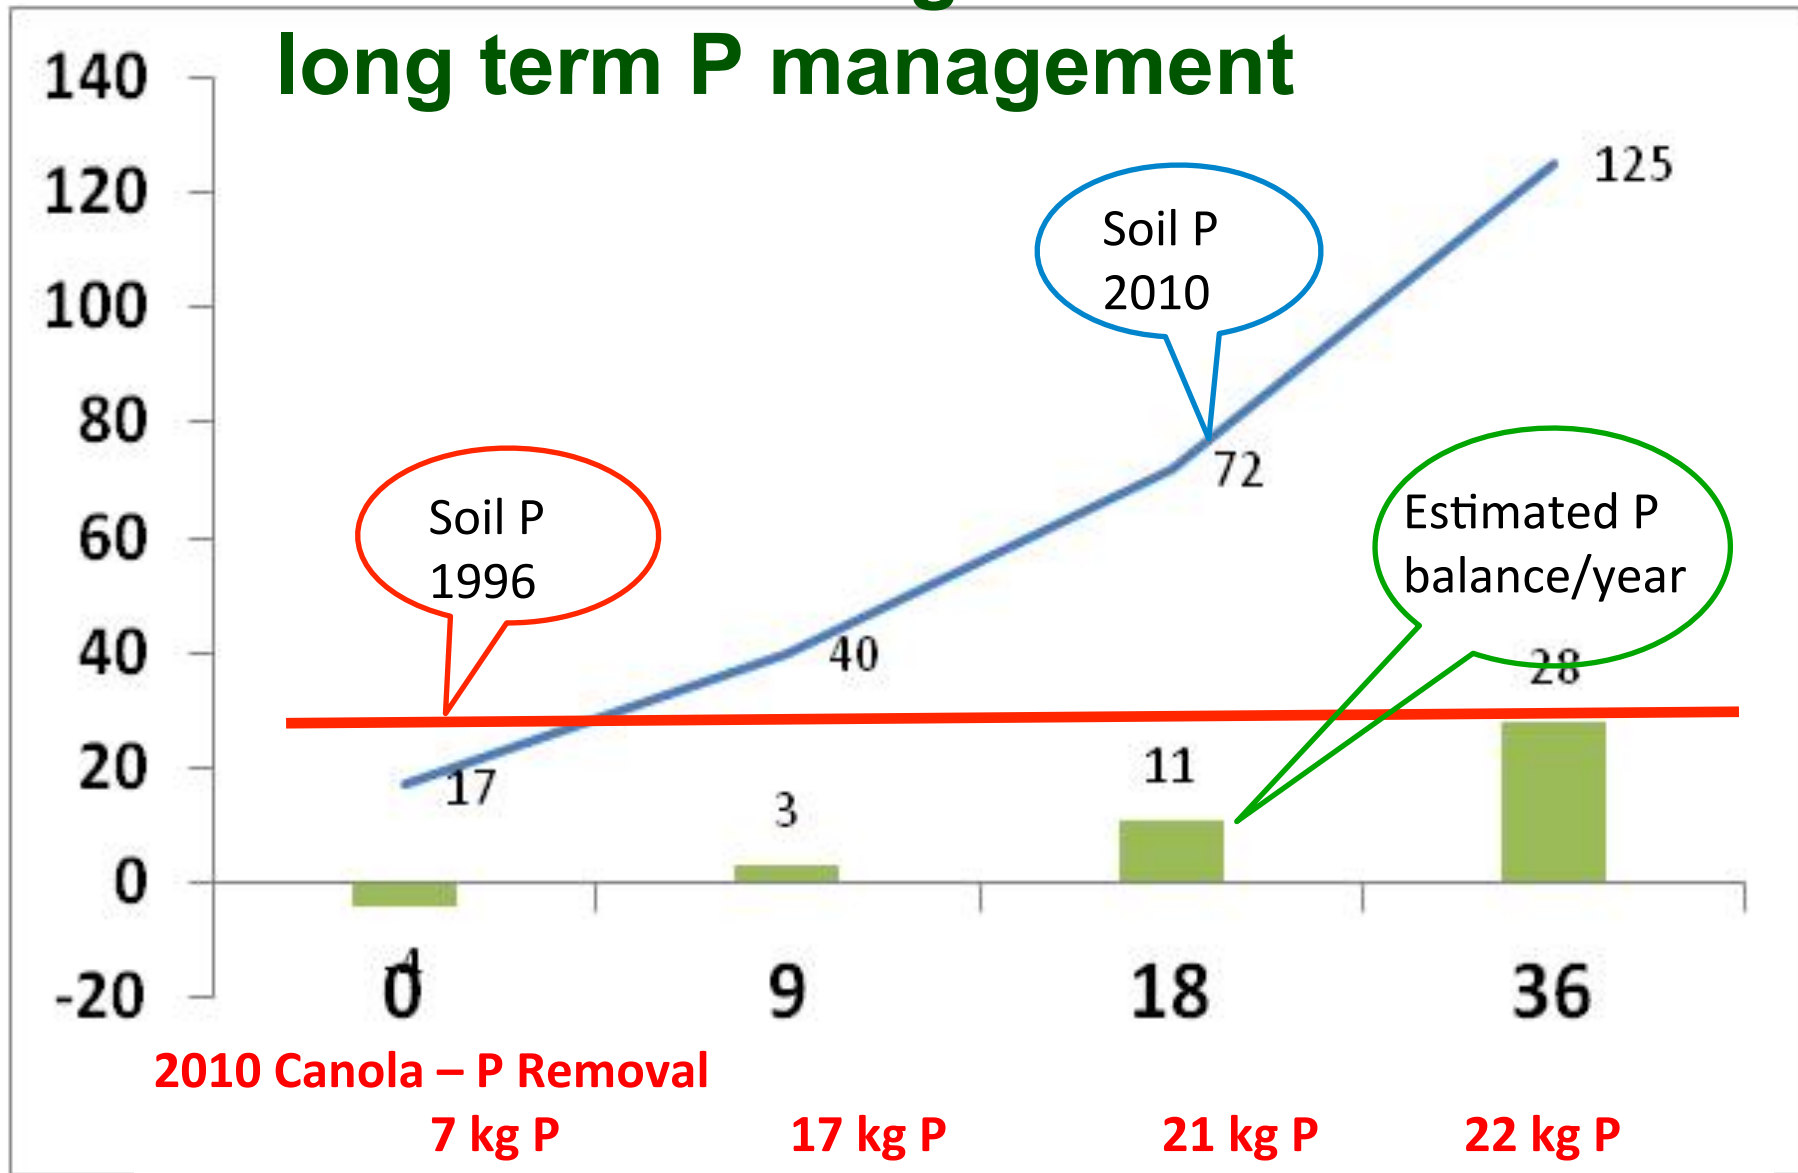

Phosphorus  
Fertilizer applied - Grain removal

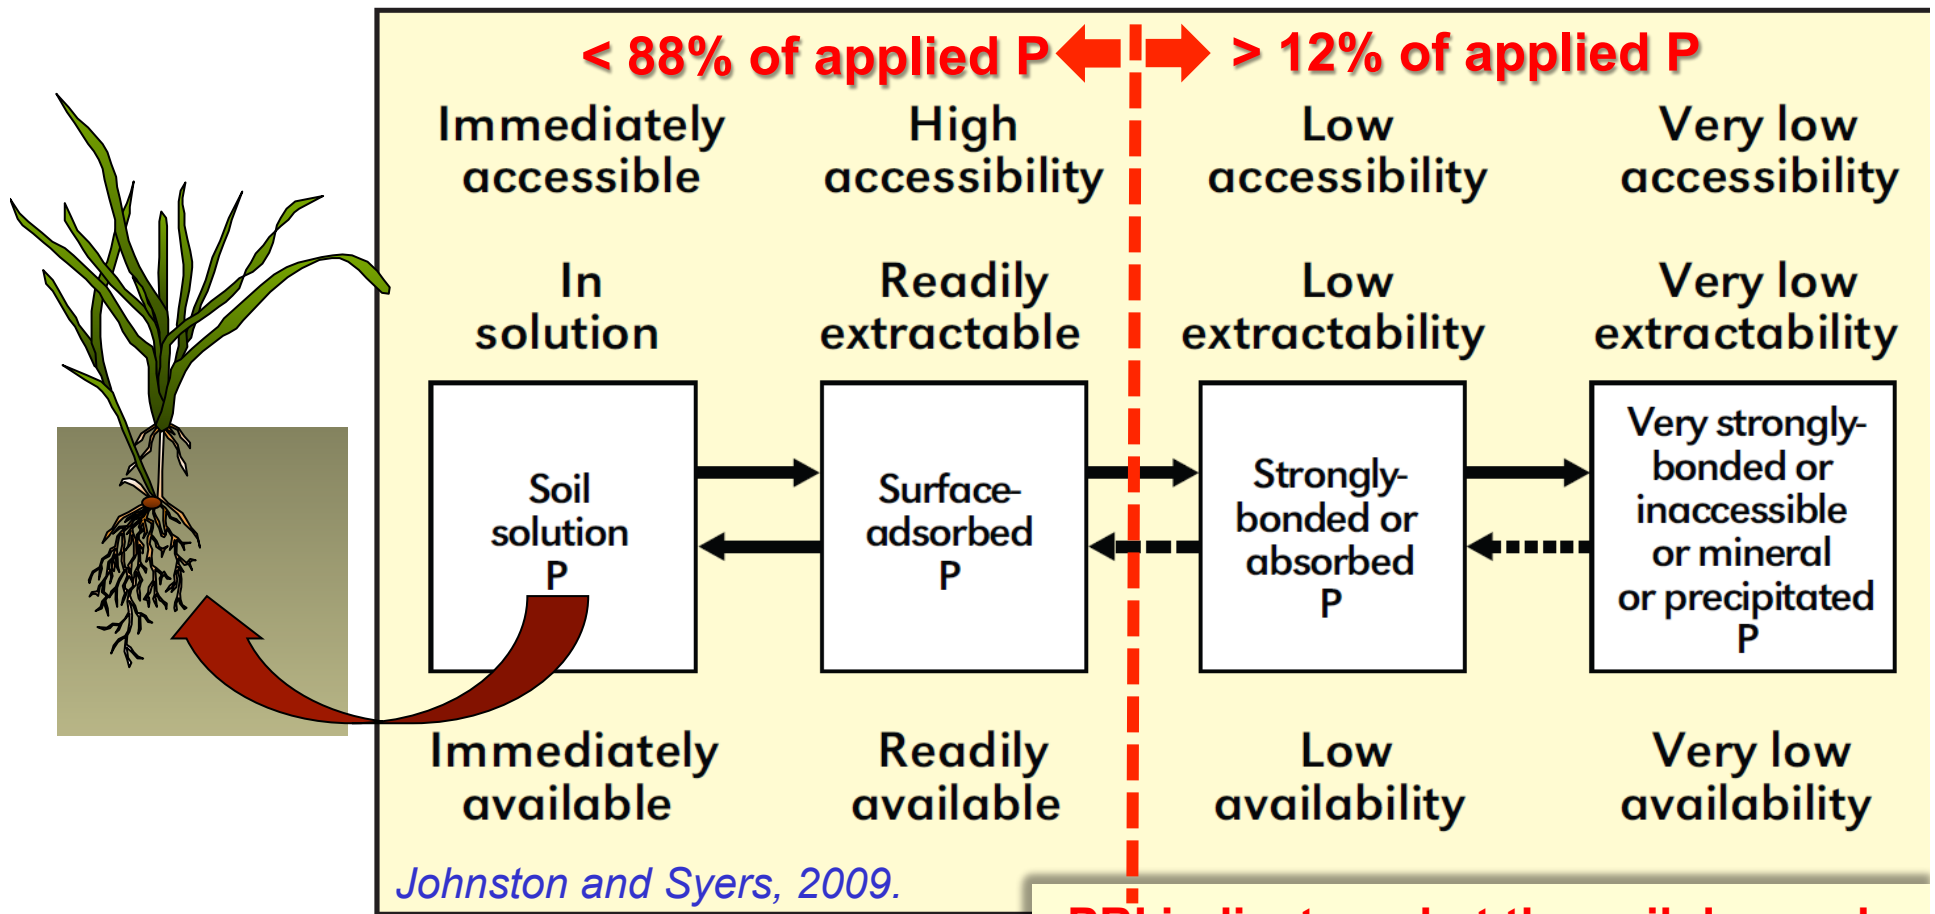

# Effects on soil P levels (top 10 cm only)

- Long term P strategy:
  - Site started at 20 mg/kg Colwell P
  - (PBI = 115 (low) *Critical P* = 35 mg/kg
  - Now
    - 0 P = 17 mg/kg      total P = 250 kg/ha = *responsive*
    - 9 P = 40 mg/kg      total P = 300 kg/ha = *near critical*
    - 18 P = 72 mg/kg      total P = 384 kg/ha = *above critical*
    - 36 P = 125            total P = 528 kg/ha = *well above critical*

# Dahlen IPL Trial Long Term P – long term P management

# Availability and extractability of soil P pools

**PBI indicates what the soil demands from the fertilizer & enters the low availability pool ... becomes plant available over time**

Recovery by balance method accounts for fertilizer P that enters the less available pools

# So what do we conclude

- In the long term annual application of 9 kg/ha P
  - has kept the soil test near critical
  - Is about in P balance of input and output
- Relatively poor years
- Top soil P only
- Does not show the whole P story
- BUT
  - **MESSAGE IS THAT IF YOUR SOIL TEST VALUES ARE AT OR NEAR CRITICAL, REPLACEMENT P IS A GOOD STRATEGY.**

# What about Nitrogen

- Similar story to P
- Includes legume N contribution about 75 kg N/ha/legume crop
- Nil N is drawing down on the soil reserves.
- 20 to 40 N is about equal to N removal

- More than 40 N applied means that more N is applied than removed.

# What happens to the excess N?

- 1996 organic C level – 1.14%, TSN = 0.096
- Top 10 cm 2011 pre-sowing
  - N alone had no significant effect on OC ( $p=0.114$ )
  - TSN did show significant ( $p=0.015$ ) increases with N
  - Difficult to compare 1996 with 2011 (bulk density).

## P also increased the OC level!

- The increase in Total Soil N was due to P stimulating legumes and therefore N fixation.
- N fixation study on lentils in 2005

P Rate	Biomass	Yield	Nfixed kg/ha	kg/t
0	3.06	0.60	37.6	13
9	4.39	1.13	53.6	11
18	5.08	1.20	65.5	12
36	4.76	1.06	72.3	13
<i>LSD</i>	0.52	0.12	10.2	<i>ns</i>

P	TSN%	%OC
0	0.108	1.089
9	0.116	1.249
18	0.124	1.330
36	0.125	1.290
<i>se</i>	0.003	0.027

# Splitting N – what did that show?

- Only two years when splitting was significantly different from an at-sowing N application
- Averaged across all N treatments
- But no interaction
- Splitting is a risk management strategy.

		<i>At Sowing</i>	<i>Split</i>	<i>p</i>
Barley	1996	<b>3.47</b>	<b>2.99</b>	<b>Sign</b>
Chickpea	1997	*	*	
Canola	1998	1.34	1.30	ns

Barley	2008	1.10	1.10	ns
Chickpea	2009	*	*	
Canola	2010	<b>2.45</b>	<b>2.63</b>	<b>0.05</b>

# So what worked out best?

- 20:9 or 40:9
  - About the most profitable
  - About in nutrient balance of input and output
    - Soil tests kept at about the same level
  - BUT
    - Relatively poor string of years
      - In better years more P and N pay off
  - BUT
    - Need to set the P status with at-sowing – maybe up P rate to meet higher demand in better years – monitor with soil tests.
    - Match N supply to season – with moderate N at sowing, little penalty with splitting.

## Effect of N & P on Ndfa

- 2005 site in lentil
- N had no effect:
- P affected growth & yield

P Rate	Biomass	Yield	Score	Nodule Wt	%Ndfa	%N	Nfixed kg/ha	kg/t
0	3.06	0.60	1.1	0.023	80	1.7	<b>37.6</b>	13
9	4.39	1.13	2.3	0.057	68	1.7	<b>53.6</b>	11
18	5.08	1.20	2.3	0.064	67	1.8	<b>65.5</b>	12
36	4.76	1.06	2.4	0.060	64	2.0	<b>72.3</b>	13
<i>LSD</i>	0.52	0.12	0.4	0.010	<i>ns</i>	<i>ns</i>	<b>10.2</b>	<i>ns</i>

- Affected nodulation,
- not %N derived from atmosphere (fixed)

# Critical P value

- A critical soil test value is based on achieving 95% of maximum yield at that value.
- Olsen P = 15 mg/kg but poor predictability
- Colwell P = value depends on soil type – better predictor of response than Olsen
- Better fertilizer decisions for crops

# Colwell P and PBI

- A critical P test value depends on soil chemistry – P buffering capacity
- PBI is a measure of how much applied P is transferred to the low availability pools
- Scale 0 to 1000
- Dahlen = 115
- Critical Colwell = 35 mg/kg

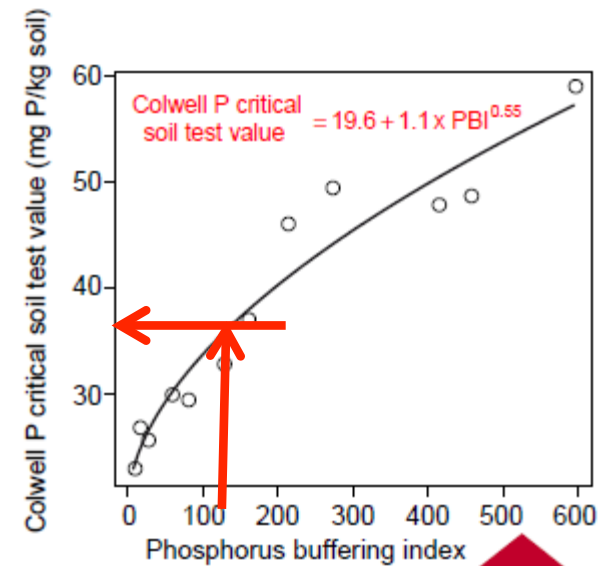

Figure 4.

The relationship between critical Colwell P value and soil P buffering index. The critical Colwell P value is the soil test value predicted to produce 95% of maximum pasture yield.

PBI Category		Critical Range
<15	Extremely Low	20-24
15-30	Very very low	24-27
36-70	Very low	27-31
<b>71-140</b>	<b>Low</b>	<b>31-36</b>
141-280	Moderate	36-44
281-840	High	44-64

# N & P interaction – as per model system?

- Wheat Phases analysed.
- In two of three years N\*P interaction
- Nature is that @0P = little N response
- Also see that timing of N had no significant effect.

Three-Way ANOVAR P values

# Long term effect on Colwell P

- Interaction between N & P - @ high N, Colwell P is less than at lower N – less P offtake @ lower N??
- N did not increase OC, +P took OC from  $0.93 \pm 0.02$  to  $1.01 \pm 0.02$
- N decreased soil pH<sub>CaCl2</sub> from  $7.3 \pm 0.1$  to  $6.9 \pm 0.1$
- Both N and P increased soil S levels.

# Long Term Colwell P

- Starting Colwell = 24 mg/kg
- Interaction between N & P - @ high N, Colwell P is less than at lower N – less P offtake @ lower N??

# P balance and soil test changes

- Rotation in P balance will be at about 32 Colwell
- Colwell P rises 0.2 mg/kg for each kg P over balance
